

NAME

`icdman` - search for keyword or print ICD manual page

SYNOPSIS

`icdman` -k keyword
`icdman` [section] entry

OPTIONS

-k Search for *keyword* in file 'whatis'.
section Search only for manual entry in specified section.

DESCRIPTION

Icdman is a program that accesses information from the on-line IC Design manual in a `man(1)`-like fashion.

With the `-k` option manual information can be searched for by keyword. *Icdman* prints out a one-line synopsis of each manual entry whose listing in the 'whatis' database contains the caseless *keyword*.

When the `-k` option is not specified *icdman* searches for a manual entry, specified by the title *entry*, and displays it on the terminal screen. If a section number is specified *icdman* looks in that section for *entry*. If section is omitted, *icdman* searches all sections of the on-line manual.

Help about the following sections is currently available:

sectionnr:	1. User Commands and Sys. Administration
	3. Sea-of-Ocean Functions
	4. File Formats
	5. DMI and LDMC Functions

NOTES

You can set the environment variable `PAGER` to use another pager program. The default pager is *less* (if found), else *more* is used.

EXAMPLES

```
% icdman icdman
% icdman -k import
% icdman dsui
% icdman 4 maskdata
```
