

NAME

`mkvopr` - make an ocean project and import other versions of digilib and analib

SYNOPSIS

mkvopr project

PARAMETERS

project Absolute or relative path of the project to be created.

DESCRIPTION

Mkvopr is a symbolic link to the *ICELLS(1ICD)* script. The *ICELLS* script is a front-end to the real *mkvopr* script. This script is to be sourced by the *ICELLS* script. It creates a NELSYS project directory for the OCEANPROCESS (default "fishbone") and imports the libraries "primitives", "g_digilib", "g_analib" and "bonding" into that project. The libraries must first be installed with the script *ICELLS(1ICD)*.

ENVIRONMENT VARS**ICDPATH**

The full path to the place where the Ocean & Nelsis tree lives. This environment variable must be set!

OCEANPROCESS

The name of the ocean process and image to use, e.g. "fishbone", "gatearray" or "octagon". The default process is "fishbone".

BINLIBS

Is set to `ICDPATH/share/lib/celllibs/OCEANPROCESS`. This variable is used by the real script and is not an environment variable. It is the path to the directory containing the binary version of the libraries.

SRCLIBS

Is set to `ICDPATH/share/lib/celllibs/OCEANPROCESS/src`. This variable is used by the real script and is not an environment variable. It is the path to the directory containing the ascii version of the libraries, as well as the template directory.

EXAMPLES

```
% mkvopr myproject
----- creating fishbone project myproject -----
----- importing primitives -----
----- importing g_digilib5_99 -----
----- importing g_analib8_00 -----
----- importing bonding11_93 -----
----- copying default config files -----

...done. Enjoy your new project "myproject" !!!
% cd myproject
```
